

Project title: Electricity Consumption Analysis using Tableau

Team ID: LTVIP2026TMIDS24253

Project Design Phase-I - Solution Fit Template

Problem–Solution Fit means identifying a real problem faced by users and ensuring that proposed solution effectively addresses that problem. In the context of this project, users such as energy planners, policy makers, and decision-makers struggle to understand electricity consumption patterns due to complex, scattered, and non-visual energy data across 35 Indian states and 5 regions. The proposed solution—interactive Tableau dashboards and scenario-based visualizations—directly addresses this challenge by transforming raw electricity consumption data into clear, meaningful, and actionable insights for strategic planning and policy development.

PURPOSE

- To solve the problem of poor understanding of electricity consumption patterns across Indian states and regions by presenting data in a clear and user-friendly manner through interactive visualizations and professional dashboards.
- To support faster and more informed energy planning decisions through interactive visual analytics that enable real-time filtering and pattern identification across temporal and geographic dimensions.
- To increase adoption of data-driven energy insights by using familiar visualization tools such as Tableau with responsive web application integration for enhanced accessibility and user experience.
- To improve communication of electricity consumption patterns and trends through storytelling dashboards that enhance awareness and support evidence-based policy making.
- To understand current challenges faced by users in interpreting electricity consumption data from multiple sources and improve their experience through better visualization, analysis, and interactive exploration capabilities.
